

Greenhouse Gas Emissions Reduction Commitment (2022–2030)

Pyrophobic Systems Ltd. recognizes its responsibility to reduce the environmental impact of its operations and to contribute to a lower-carbon future through responsible resource management and continuous improvement.

Using 2022 as our baseline year, Pyrophobic Systems Ltd. is committed to achieving a 30% reduction in Scope 1 and Scope 2 greenhouse gas emissions per unit of production by 2030. As a growing manufacturer, we have adopted an intensity-based target so that our emissions performance is measured independently of business growth, and we will report both our emissions intensity and our total absolute emissions as part of our annual review.

This commitment applies to emissions generated from our operations, including natural gas, propane, company-owned vehicles, and purchased electricity.

To achieve this objective, Pyrophobic Systems Ltd. will pursue continuous improvement in energy efficiency, including electrification of thermal loads where feasible, alongside operational performance and greenhouse gas management. We will monitor our emissions regularly, evaluate opportunities to reduce our environmental impact, and invest in practical, sustainable solutions that support our long-term environmental objectives while maintaining the quality, safety, and reliability of our products and services.

Progress toward this commitment will be reviewed annually through our greenhouse gas inventory and environmental management processes. We will measure our performance against the 2022 baseline, report our progress transparently, and update our plans as needed to remain on track toward our 2030 target. We recognize this is an ambitious objective, and we are committed to pursuing it with the same rigour we apply to the quality and safety of our products.

This commitment is made with the full support and sponsorship of our leadership team.
